

calsyntenin-2 (T-16): sc-102403

BACKGROUND

Members of the calsyntenin protein family are localized to the post-synaptic membrane of excitatory central nervous system (CNS) synapses. Calsyntenin-2, also known as Alcadin- γ , is a 955 amino acid protein that localizes to the endoplasmic reticulum, Golgi apparatus and plasma membranes. Containing 2 cadherin-like repeats in its N-terminal extracellular region, calsyntenin-2 binds synaptic calcium with its cytoplasmic domain, suggesting a role in the modulation of calcium-mediated postsynaptic signals. Under normal physiological conditions, calsyntenin-2 is proteolytically processed in an event in which the primary ζ -cleavage generates a short C-terminal transmembrane fragment and a long extracellular N-terminal domain.
