GalNAc-T4 (N-12): sc-107552

The Power to Question

BACKGROUND

The UDP-N-acetyl- α -D-galactosamine:polypeptide N-acetylgalactosaminyl-transferase (GalNAc-T) family of enzymes are substrate-specific proteins that catalyze the transfer of GalNAc (N-acetylgalactosamine) to serine and threonine residues onto various proteins, thereby initiating mucin-type O-linked gly-cosylation in the Golgi apparatus. GalNAc-T4 (Polypeptide N-acetylgalactosaminyltransferase 4), also known as UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 4, is a 578 amino acid protein that displays high enzymatic activity toward Muc7, Muc2 and EA2. GalNAc-T4 also glycosylates PSGL-1 on threonine 57. Its N-terminal domain is involved in substrate binding and manganese coordination, while the C-terminal domain is involved in UDP-Gal binding and catalytic reaction. Though ubiquitously expressed, GalNAc-T4 is found at highest levels in mucosal cells.
