

HS3ST3A1 (P-12): sc-107603

BACKGROUND

Heparan sulfate structures, which are responsible for executing multiple biologic activities, are generated and regulated by heparan sulfate biosynthetic enzymes. HS3ST3A1 (heparan sulfate (glucosamine) 3-O-sulfotransferase 3A1), also known as 3OST3A1 or HS3ST3A, is a 406 amino acid single-pass type II membrane protein that localizes to the Golgi apparatus and belongs to the heparan sulfate biosynthetic enzyme family. Expressed ubiquitously and present at higher levels in placenta, heart, kidney and liver, HS3ST3A1 functions as a heparan sulfate glucosaminyl 3-O-sulfotransferase that specifically transfers a sulfuryl group to an N-unsubstituted glucosamine linked to a 2-O-sulfo iduronic acid unit on heparan sulfate. The gene encoding HS3ST3A1 maps to human chromosome 17, which comprises over 2.5% of the human genome and encodes over 1,200 genes.
