ZNF213 (Q-13): sc-132912

The Power to Overtin

BACKGROUND

Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a krüppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. ZNF213 (zinc finger protein 213), also known as CR53 or ZKSCAN21, is a 459 amino acid protein that contains 5 $\rm C_2H_2$ -type zinc fingers, one KRAB domain and one SCAN box domain. Localized to the nucleus and expressed at high levels in the testis, ZNF213 belongs to the krüppel $\rm C_2H_2$ -type zinc-finger protein family and is thought to be involved in transcriptional regulation.
