Tiam2 (N-19): sc-13303

BACKGROUND

A gene designated Tiam1 was orginally identified as an invasion-inducing gene by proviral tagging in combination with *in vitro* selection for invasiveness. The noninvasive cells were made invasive by transfection of truncated Tiam1 cDNAs into the noninvasive cells. The predicted Tiam1 protein exhibits both Dbl and Pleckstrin-homologous domains. In fibroblasts, Tiam1 induces a phenotype similar to that of constitutively activated (V12) Rac1, including membrane ruffling, which is inhibited by dominant negative (N17) Rac1. T cell lymphoma invasion and metastasis 2 (Tiam2) is expressed as a 3.3 kb transcript in the cerebrum and as an 4.4 kb transcript in the cerebellum and testis. The 4.4 kb message encodes a longer form of the 3.3 kb mRNA predicted protein, and both contain homology to the Dbl-homologus region and Pleckstrin-homologous regions of Tiam1. Purified Tiam2 shows GDP-GTP exchange activity.
