ZNF785 (D-13): sc-133030

The Power to Question

BACKGROUND

Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a Krüppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. Zinc finger protein 688 (ZNF688) is a 276 amino acid member of the Krüppel C_2H_2 -type zinc-finger protein family. Localized to the nucleus, ZNF688 contains two C_2H_2 -type zinc fingers and one KRAB domain through which it is thought to be involved in DNA-binding and transcriptional regulation. Zinc finger protein 785 (ZNF785) is a 405 amino acid member of the Krüppel C_2H_2 -type zinc-finger protein family. ZNF785 contains seven C_2H_2 -type zinc fingers and one KRAB domain. Two isoforms of ZNF785 exist as a result of alternative splicing events.
