The Power to Question

BACKGROUND

Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a Krüppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. ZNF879 (zinc finger protein 879) is a 563 amino acid protein belonging to the Krüppel C_2H_2-type zinc-finger protein family. ZNF879 contains thirteen C_2H_2-type zinc fingers and one KRAB domain. This nuclear protein is likely involved in transcriptional regulation. The gene encoding ZNF879 maps to human chromosome 5, which contains 181 million base pairs and comprises nearly 6% of the human genome. Deletion of the p arm of chromosome 5 leads to Cri-du-chat syndrome, while deletion of the q arm or of chromosome 5 altogether is common in therapy-related acute myelogenous leukemias and myelodysplastic syndrome.
