The Power to Question

#### **BACKGROUND**

Translation initiation in eukaryotes necessitates the assembly of an 80S ribosomal complex. Eukaryotic initiation factors (elFs) are utilized in a sequence of reactions that leads to 80S ribosomal assembly and initiation of translation. Mammalian eukaryotic translation initiation factor 4F (elF4F) is a protein complex that contains elF4A, elF4E and elF4G, binds mRNA at a 5'-cap motif and recruits the 43S ribosomal preinitiation complex to the transcript. Along with elF4B, the elF4F complex mediates the unwinding of mRNA secondary structure to facilitate ribosome association. elF4E specifically interacts with the 5' cap, elF4A is a bidirectional RNA helicase, and elF4GI and elF4GII are scaffolding proteins which coordinate elF4E, elF4A, elF3 and the 40S ribosome. elF4GII (also known as elF4G3 and elF4-g3) is a 1,585 amino acid protein that is 46% homologous and functionally similar to elF4GI.
