The Power to Question

BACKGROUND

PCYOX1 (prenylcysteine oxidase 1), also known as prenylcysteine lyase or PCL1, is a 505 amino acid FAD-dependent thioether oxidase belonging to the prenylcysteine oxidase family. Ubiquitously expressed, PCYOX1 has been found to catalyze the degradation of prenylcysteine into free cysteines and a hydrophobic isoprenoid, and is released during the degradation of prenyl-Lated proteins. PCYOX1 specifically cleaves the thioether bond of prenyl-L-cysteines, such as farnesylcysteine and geranylgeranylcysteine. PCYOX1 is glycosylated at multiple N-glycosylation sites and is encoded by a gene that maps to human chromosome 2p14. PCYOX1 has recently been implied to play a significant role in atherogenesis, and may function as a VLDL (very low-density lipoprotein)-associated protein.
