The Power to Question

#### **BACKGROUND**

Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a Krüppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. As a member of the krueppel  $C_2H_2$ -type zinc-finger protein family, ZNF14 (zinc finger protein 14), also known as Zinc finger protein KOX6 and GIOT4 (gonadotropin-inducible ovary transcription repressor 4), is a 642 amino acid nuclear protein that contains one KRAB domain and nineteen  $C_2H_2$ -type zinc fingers. The gene encoding ZNF14 maps to human chromosome 19, which consists of over 63 million bases, houses approximately 1,400 genes and is recognized for having the greatest gene density of the human chromosomes.
