## BACKGROUND

Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a Krüppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. FEZF2 (FEZ family zinc finger 2), also known as FEZ, TOF, FEZL, FKSG36 or ZNF312, is a 459 amino acid nuclear protein that belongs to the Krüppel C 2 H 2 -type zinc-finger protein family. Considered a transcription repressor, FEZF2 is required for the specification of corticospinal motor neurons and other subcerebral projection neurons. FEZF2 may play a role in layer and neuronal subtype-specific patterning of subcortical projections and axonal fasciculation. FEZF2 controls the development of dendritic arborization and spines of large layer $V$ pyramidal neurons.
