

DHCR24 (H-300): sc-134568

BACKGROUND

Dehydrocholesterol reductase proteins (DHCR proteins) are involved in cholesterol biosynthesis. DHCR7, also designated sterol δ -7-reductase or 7-DHC reductase, reduces the C7-C8 double bond of 7-dehydrocholesterol. It is a multi-pass membrane protein localizing to the endoplasmic reticulum (ER). Defects in the DHCR7 gene can cause Smith-Lemli-Opitz syndrome (SLOS), an autosomal recessive disorder of sterol metabolism. DHCR24 acts as a catalyst for the reduction of the δ -24 double bond of sterol intermediates. DHCR24, also designated 3- β -hydroxysterol δ -24-reductase or Seladin-1, binds to FAD and is predominantly expressed in adrenal gland and brain. It is a single-pass membrane protein localizing to the ER or Golgi apparatus. Defects in the DHCR4 gene cause cause the autosomal recessive disorder desmosterolosis.
