The Power to Question

BACKGROUND

ARID3C (AT rich interactive domain 3C) is a 412 amino acid nuclear protein containing an ARID domain that is a member of the AT-rich interaction domain family of proteins. ARID family members are involved in embryonic patterning, cell lineage gene regulation, cell cycle control, transcriptional regulation and chromatin structure modification. The ARID domain is a helix-turn-helix motif-based DNA-binding domain. The gene encoding ARID3C is located on human chromosome 9, which houses over 900 genes and comprises nearly 4% of the human genome. Hereditary hemorrhagic telangiectasia, which is characterized by harmful vascular defects and familial dysautonomia, are both associated with chromosome 9. Notably, chromosome 9 encompasses the largest interferon family gene cluster.
