Protor-2 (V-13): sc-138545

BACKGROUND

mTOR is a large protein kinase that is important in cell growth and functions as the mammalian target of rapamycin, an immunosuppressant that blocks vessel restenosis and also has potential anticancer applications. Rapamycininsensitive companion of mTOR, also designated Rictor, forms a complex (designated mTORC2) with mTOR that directly phosphorylates Akt/PKB on Ser 473 and plays a key role in growth signaling pathways. Protor-2, also known as PROTOR2 or FLJ14213, is a 368 amino acid protein that is thought to interact with the mTORC2 complex and, via this interaction, may regulate organization of the actin cytoskeleton. Three isoforms of Protor-2 are expressed due to alternative splicing events.
