DND1 (N-15): sc-160300

The Power to Question

BACKGROUND

Primordial germ cells (PGCs) are precursor germ cells that divide rapidly and migrate toward the developing gonads. DND1 (dead end protein homolog 1), also known as RBMS4 (RNA-binding motif, single-stranded-interacting protein 4), is a 353 amino acid protein that contains 2 RRM (RNA recognition motif) domains and localizes to perinuclear germ granules within PGCs. Expressed specifically in PGCs throughout embryogenesis, DND1 is thought to play a role in PGC development, but is not necessary for PGC migration to gonadal regions. Mutations in the gene encoding DND1 may result in germ cell loss and the subsequent development of testicular germ cell tumors, suggesting that DND1 may play a role in tumorigenesis.
