The Power to Question

### **BACKGROUND**

Mitochondrial ribosomes consist of a large subunit and a small subunit, both of which are comprised of multiple mitochondrial ribosomal proteins (MRPs) that are encoded by nuclear genes and are essential for protein synthesis within mitochondria. MTG1 (mitochondrial GTPase 1), also known as GTP or GTPBP7, is a 334 amino acid mitochondrial protein belonging to the MMR1/HSR1 GTP-binding protein family. Existing as two alternatively spliced isoforms, MTG1 may participate in the assembly of the large ribosomal subunit. MTG1 is encoded by a gene located on human chromosome 10, which houses over 1,200 genes and comprises nearly 4.5% of the human genome. Defects in some of the genes that map to chromosome 10 are associated with Charcot-Marie Tooth disease, Jackson-Weiss syndrome, Usher syndrome, nonsyndromatic deafness, Wolman's syndrome, Cowden syndrome, multiple endocrine neoplasia type 2 and porphyria.
