

CCDC76 (N-12): sc-161446

BACKGROUND

CCDC76 (coiled-coil domain containing 76), also known as tRNA guanosine-2'-O-methyltransferase TRM13 homolog or tRNA [Gm4] methyltransferase, is a 481 amino acid protein belonging to the TRM13 family. Encoded by a gene that maps to human chromosome 1p21.2, CCDC76 specifically methylates guanosine-4 in various tRNAs with a Gly(CCG), His or Pro signature. CCDC76 contains one CHHC-type zinc finger and exists as two alternatively spliced isoforms. CCDC76 participates in metal ion binding and methyltransferase and transferase activities. Triggered by the suppression of hnRNP A2 in Colo16 cells, CCDC76 metabolic pathways and transcriptional responses are affected. CCDC76 is significantly regulated by 8Br-cAMP and may affect endocrine/paracrine/autocrine signals in the ovary. CCDC76 may also play a role in endometriosis.
