The Power to Question

BACKGROUND

The YIP1 family consists of a group of small membrane proteins that bind Rab GTPases and function in membrane trafficking and vesicle biogenesis. YIPF3 (YIP1 family member 3), also known as KLIP1 (killer lineage protein 1) or FinGER3, is a 350 amino acid cytoplasmic and multi-pass membrane protein belonging to the YIP1 family. Involved in hematopoiesis, YIPF3 is found in fetal liver and is expressed by nucleated hematopoietic cells. The gene encoding YIPF3 maps to human chromosome 6, which contains 170 million base pairs and comprises nearly 6% of the human genome. Deletion of a portion of the q arm of chromosome 6 is associated with early onset intestinal cancer, suggesting the presence of a cancer susceptibility locus. Additionally, Porphyria cutanea tarda, Parkinson's disease, Stickler syndrome and a susceptibility to bipolar disorder are all associated with genes that map to chromosome 6.
