**BACKGROUND**

Transient receptor potential cation (TRPC) channels are a superfamily of 6 transmembrane segment-spanning, gated cation channels. TRPC subtypes mediate store-operated Ca\(^{2+}\) entry, a process involving Ca\(^{2+}\) influx and replenishment of Ca\(^{2+}\) stores formerly emptied through the action of inositol 1,4,5-trisphosphate production and other Ca\(^{2+}\) mobilizing agents. TRPC ion channels influence calcium-depletion induced calcium influx processes in response to chemo-, mechano- and osmoregulatory events. Human TRPC1 protein is a 793 amino acid cation channel that is expressed in fetal and adult brain, and adult heart, testis and ovaries, where it may influence store-operated Ca\(^{2+}\) entry as a component of capacitative calcium entry (CCE) complexes. The activation of store-mediated Ca\(^{2+}\) entry in human cells occurs through the association between inositol 1,4,5-trisphosphate receptors and TRPC1.
