UCP4 (H-100): sc-20815

The Power to Question

BACKGROUND

A significant portion of the metabolic rate of endotherm is attributable to counteracting uncoupling, wherein a flux of protons down the electrochemical gradient generates heat independently of ATP production. Uncoupling is apparent in thermogenic brown adipose tissue, which expresses tissue-specific uncoupling protein (UCP), suggesting that innate uncoupling and metabolic rate are regulated by UCPs. UCPs are a family of mitochondrial transporter proteins that are implicated in thermoregulatory heat production and maintenance of the basal metabolic rate. A brain-specific novel member of UCP family, UCP4, is most related to UCP3 and possesses features characteristic of mitochondrial transporter proteins. Unlike other known UCPs, UCP4 mRNAs are expressed in both fetal and adult brain tissues. Human UCP4, a 323 amino acid protein, has been speculated on its participation in apoptosis because of its early phylogenetic occurrence. Brain UCP4 mRNA rose by 1.5 fold in response to acute cold exposure, suggesting UCP4 is involved in tissue-specific thermoregulation and metabolic changes. The UCP-specific sequences are found in the first, second and fourth α -helices and are involved in fatty acid anion binding and translocation.
