The Power to Question

#### **BACKGROUND**

CCDC99 (coiled-coil domain-containing protein 99), also know as SPDL-1, is a 605 amino acid protein that is phosphorylated upon DNA damage and is expressed as 2 isoforms due to alternative splicing events. The gene encoding CCDC99 is located on chromosome 5. With 181 million base pairs encoding around 1,000 genes, chromosome 5 is about 6% of human genomic DNA. Chromosome 5 is associated with Cockayne syndrome through the ERCC8 gene and familial adenomatous polyposis through the adenomatous polyposis coli (APC) tumor suppressor gene. Treacher Collins syndrome is also chromosome 5 associated and is caused by insertions or deletions within the TCOF1 gene. Deletion of the p arm of chromosome 5 leads to cri du chat syndrome. Deletion of 5q or chromosome 5 altogether is common in therapy-related acute myelogenous leukemias and myelodysplastic syndrome.
