

# CD300E (S-17): sc-242394

## BACKGROUND

CD300E (CD300 antigen-like family member E), also known as CD300LE, CLM2 (CMRF35-like molecule 2), CMRF35A5 or IREM2 (immune receptor expressed on myeloid cells 2), is a 205 amino acid single-pass type I membrane protein that contains one Ig-like V-type (immunoglobulin-like) domain and belongs to the CD300 family. Interacting with DAP12, CD300E most likely functions as an activating receptor. CD300E is present on the surface of mature hematopoietic cells of the monocyte and myeloid lineages. The gene that encodes CD300E consists of approximately 13,872 bases and maps to human chromosome 17q25.1. Comprising over 2.5% of the human genome, chromosome 17 consists of about 81 million bases, encodes over 1,200 genes and has the highest gene density in the genome. Chromosome 17 is also enriched in segmental duplications, ranking third in density among the autosomes.
