The Power to Question

### **BACKGROUND**

CCDC149 (coiled-coil domain containing 149), also known as DKFZp761B107 or FLJ13410, is a 474 amino acid protein expressed as 3 isoforms produced by alternative splicing events. The gene that encodes CCDC149 maps to human chromosome 4. Human chromosome 4 represents approximately 6% of the human genome and contains nearly 900 genes. Notably, the Huntingtin gene, which is found to encode an expanded glutamine tract in cases of Huntington's disease, is located on chromosome 4. FGFR-3 is also encoded by a gene that maps to human chromosome 4 and has been associated with thanatophoric dwarfism, achondroplasia, Muenke syndrome and bladder cancer. Chromosome 4 is also tied to Ellis-van Creveld syndrome, methylmalonic acidemia and polycystic kidney disease.
