# Tctex1D1 (E-17): sc-248795

BACKGROUND

Tctex1, also designated CW-1 or TCTEL1, is expressed in heart, placenta, skeletal muscle, kidney, pancreas, spleen, prostate, testis, ovary, ileum and colon, where it functions as a cytoplasmic Dynein light chain and is found in a complex with Na<sup>+</sup> CP type X $\alpha$ . Tctex1D1 (Tctex1 domain containing 1) is a 179 amino acid protein that exists as multiple alternatively spliced isoforms and may function in a similar manner to Tctex1. The gene encoding Tctex1D1 maps to human chromosome 1, which spans 260 million base pairs, contains over 3,000 genes and comprises nearly 8% of the human genome. Chromosome 1 houses a large number of disease-associated genes, including those that are involved in familial adenomatous polyposis, Stickler syndrome, Parkinsons disease, Gaucher disease, schizophrenia and Usher syndrome. Aberrations in chromosome 1 are found in a variety of cancers, including head and neck cancer, malignant melanoma and multiple myeloma.
