# BACKGROUND

The tetratricopeptide repeat (TPR) motif is a degenerate, 34 amino acid sequence found in many proteins and acts to mediate protein-protein interactions in various pathways. At the sequence level, there can be up to 16 tandem TPR repeats, each of which has a helix-turn-helix shape that stacks on other TPR repeats to achieve ligand binding specificity. TTC15 (TPR repeat protein 15), also known as TRAPPC12 (trafficking protein particle complex subunit 12) or CGI-87, is a 735 amino acid protein that contains 4 TPR repeats. Localizing to the endoplasmic reticulum (ER)-Golgi intermediate compartment, TTC15 may be involved in the early stage trafficking between the ER and Golgi apparatus, and is a component of the TRAPP tethering complex. The gene encoding TTC15 maps to human chromosome 2p25.3.
