The Power to Question

BACKGROUND

Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a Krüppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. ZNF10 (zinc finger protein 10), also known as KOX1, is a 573 amino acid protein that localizes to the nucleus and contains one KRAB domain and 11 CHH2-type zinc fingers. One of several members of the Krüppel C_2H_2 -type zinc-finger protein family, ZNF10 exists as multiple alternatively spliced isoforms and is thought to play a role in transcriptional regulation. The gene encoding ZNF10 maps to human chromosome 12, which houses over 1,100 genes and comprises approximately 4.5% of the human genome.
