

# ZNF764 (S-12): sc-249768

## BACKGROUND

Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a Krüppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. ZNF764 (zinc finger protein 764) is a 408 amino acid protein that localizes to the nucleus and contains 7 C<sub>2</sub>H<sub>2</sub>-type zinc fingers and a KRAB domain. One of several members of the Krüppel C<sub>2</sub>H<sub>2</sub>-type zinc-finger protein family, ZNF764 is thought to be involved in transcriptional regulation events. The gene encoding ZNF764 maps to human chromosome 16, which encodes over 900 genes and comprises nearly 3% of the human genome.
