

# ARK5 (A-9): sc-271827

## BACKGROUND

5'-AMP-activated protein kinase, known as AMPK, is a heterotrimeric complex that protects cells from stresses that cause ATP depletion by switching off ATP-consuming biosynthetic pathways. Activated AMPK phosphorylates and regulates hydroxymethylglutaryl-CoA reductase and acetyl-CoA carboxylase, which are key regulatory enzymes of sterol synthesis and fatty acid synthesis, respectively. The AMPK-related kinase 5 (ARK5) is a tumor progression-associated factor that is directly phosphorylated by Akt at Ser 600, which is in its regulatory domain. NDR2, a serine/threonine protein kinase, phosphorylates and activates ARK5 during Insulin-like growth factor (IGF)-I signaling in order to promote cell survival. This activation may be involved in the invasion of colorectal cancer cell lines. Furthermore, ARK5 is a transcriptional target of the Large-MAF family and may have a role in mediating the aggressiveness of c-Maf- and MafB-expressing myelomas.
