

UltraCruz Goat Copper Bolus™

your partner for a healthy herd

A powerful dose of Copper Oxide in bolus form to help maintain healthy levels of copper in your goat's diet, ensuring healthy growth and fertility. Available for both kid and adult goats.

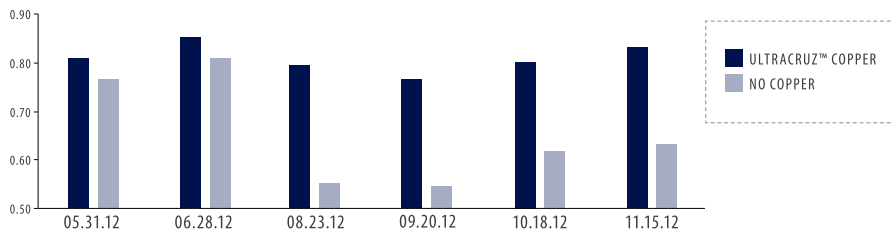

UltraCruz Goat Copper Bolus™

Provides a Slow-Release Source of Copper

Copper is a very important component of the everyday diet of goats. It allows the body to absorb and utilize iron, works with Vitamin C to form a vital component of muscle (elastin), assists with the formation of bone structure and red blood cells, and is involved in many other everyday anatomical processes. When goats don't get enough of this vital trace mineral, many problems can ensue. Anemia, weak bones and malfunction of the arterial walls are some of the most commonly seen effects. Deficiency is an incredibly common problem that can be caused by a number of factors, including copper-deficient diets (such as alfalfa), water with abnormally high levels of sulfur (which reduces the availability of copper in the body) or a lack of copper supplementation in copper-deficient regions. Our **UltraCruz Goat Copper Bolus for Adults™** and **UltraCruz Goat Copper Bolus for Kids™** ensures that your herd is getting the perfect amount of copper to keep them strong and healthy.

That's the UltraCruz™ Advantage!

* Average copper values in goats given UltraCruz™ copper and no copper.

INGREDIENTS

(per recommended kid dosage—1 bolus, 2 g): Copper Oxide (2 g)

(per recommended adult dosage—1 bolus, 4 g): Copper Oxide (4 g)

RECOMMENDATIONS FOR USE:

Goats up to 50 pounds body weight and up to 3 months of age: 1 (2 g) capsule.
Goats over 50 pounds body weight and over 3 months of age: 1 (4 g) capsule.

A single dose typically lasts 8 months to 1 year.

Administer the capsule orally with a suitable balling gun. To be effective, capsules must be swallowed. Administer only intact capsules. Do not crush or break. Do not administer to sheep. Do not administer to goats of unknown copper status or those supplemented with other sources of copper. Do not administer to newborn goats. Copper toxicity in neonates has been reported. Do not use in goats suffering from jaundice or any other liver disorder. Under most conditions, readministration will not be necessary for at least 12 months. Excessive levels of molybdenum, selenium, sulfur or iron in feed or water may impair copper absorption.

Available only from Santa Cruz Animal Health.
