

syncollin (A-7): sc-376810

BACKGROUND

Syncollin (SYCN), also known as SYL, INSSA1 or Insulin synthesis-associated protein 1, is a 134 amino acid protein expressed in pancreatic acinar cells. Localizing to secretory vesicle membranes of cytoplasmic vesicles and the luminal side of peripheral membranes, syncollin plays a role in exocytosis and is thought to influence maturation or concentration of zymogens in zymogen granules. The gene encoding syncollin maps to human chromosome 19, which consists of over 63 million bases, houses approximately 1,400 genes and is recognized for having the greatest gene density of the human chromosomes. It is the genetic home for a number of immunoglobulin (Ig) superfamily members, including the killer cell and leukocyte Ig-like receptors, a number of ICAMs, the CEACAM and PSG family and Fc receptors (FcRs).
