The Power to Question

#### **BACKGROUND**

Orphan nuclear receptors NR1D1 and NR1D2 are more commonly designated Rev-erb $\alpha$  and Rev-erb $\beta$ , respectively. Rev-erb $\alpha$  acts as a receptor for tri-iodothyronine and is composed of three domains: a modulating N-terminal domain, a C-terminal steroid binding domain and a DNA-binding domain. Rev-erb $\beta$  binds to the sequences 5'-AATGTAGGTCA-3' and 5'-ATAACTAGGT-CA-3' and acts as a competitive repressor of ROR $\alpha$  function. It interacts with NCOA5 co-activator which leads to an increase in transcription. Both Rev-erb $\alpha$  and Rev-erb $\beta$  are nuclear proteins belonging to the nuclear hormone receptor family of proteins.
