RLA-DR (RDR34): sc-52610

SANTA CRUZ BIOTECHNOLOGY

The Power to Question

BACKGROUND

Several class II α and β chain genes of the rabbit major histocompatability complex have been classified into three distinct subregions, R-DP, R-DQ and R-DR, based on their homology to the corresponding HLA-DP, -DQ and -DR genes. Studies indicate that the rabbit germline contains a total of approximately seven class II β genes, one DQ β, one DP β and five DR β. R-DQ and R-DR molecules show expression on cell surfaces, whereas R-DP molecules exhibit low levels of expression in the spleen. The constitutive coexpression of the major histocompatibility complex (MHC) class II genes in B lymphocytes requires positive, *trans*-acting transcriptional factors, although the mechanism by which the *trans*-acting factors exert their effect on gene transcription is unknown.

SOURCE

RLA-DR (RDR34) is a mouse monoclonal antibody raised against Leukemic B-cell line of rabbit origin.

STORAGE

Store at 4° C, **DO NOT FREEZE**. Stable for one year from the date of shipment. Non-hazardous. No MSDS required.

PRODUCT

Each vial contains 100 µg IgG_{2b} in 1.0 ml of PBS with < 0.1% sodium azide and 0.1% gelatin.

RLA-DR (RDR34) is available conjugated phycoerythrin (sc-52610 PE, 100 tests in 2 ml), for IF, IHC(P) and FCM.

APPLICATIONS

RLA-DR (RDR34) is recommended for detection of RLA-DR of rabbit origin by immunoprecipitation [1-2 µg per 100-500 µg of total protein (1 ml of cell lysate)] , immunofluorescence (starting dilution 1:50, dilution range 1:50-1:500) and flow cytometry (1 µg per 1 x 10^6 cells).

RESEARCH USE

For research use only, not for use in diagnostic procedures.

PROTOCOLS

See our web site at www.scbt.com for detailed protocols and support products.
