Astrovirus are uniformly small, spherical viruses which measure 28 nm in diameter and have a characteristic star-like appearance when viewed with an electron microscope. Astroviruses, which belong to the Astroviridae family, have been divided into eight human species, designated human Astrovirus (HAstV)-1 through HAstV-8. Seven human Astrovirus serotypes have been identified, three of which have been fully sequenced. Astrovirus-1 represents the most common of the five serotypes. Astroviruses have a positive-sense single-stranded RNA genome. Unlike the caliciviruses, astroviruses do not encode a helicase. Astrovirus infection causes gastroenteritis, a relatively mild form of rotavirus enteritis with symptoms of diarrhea, vomiting and abdominal pain, that generally persist for a few days.
