The Power to Question

#### **BACKGROUND**

GPR61 (probable G protein-coupled receptor 61, biogenic amine receptor-like G protein-coupled receptor) is a 451 amino acid protein encoded by the human GPR61 gene. GPR61 is an orphan receptor member of the G protein-coupled receptor 1 family. G protein-coupled receptors (GPCRs, or GPRs) contain seven transmembrane domains and transduce extracellular signals through hetero-trimeric G proteins. Key roles for G protein-coupled receptors include control of protein maturation and cell surface delivery, and providing the correct framework for interactions with both heterotrimeric G proteins and arrestins to allow signal generation and termination. GPR61 is expressed in brain tissue, most notably frontal and temporal lobes, occipital pole, amygdala and hippocampus. It is also expressed in testis.
