

HSV-2 gB (1.B.44): sc-57857

BACKGROUND

Membrane fusion is crucial for the entry, spread and formation of enveloped viruses, such as herpes simplex virus, and is mediated by envelope glycoproteins. Two serotypes of the herpes simplex virus, HSV-1 (also known as type 1 or oral) and HSV-2 (type 2 or genital), have been shown to encode at least ten glycoproteins, four of which are necessary and sufficient to facilitate fusion. These four glycoproteins include glycoprotein B (gB), glycoprotein D (gD), glycoprotein H (gH) and glycoprotein L (gL). The fusion event is dependent upon the expression of a gD receptor on target cell membranes and does not require the presence of cell-surface glycosaminoglycans. Glycoprotein B is essential for viral growth, as gB-free virions are able to bind cells but not to synthesize virus-specific proteins upon infection. HSV-1 and HSV-2 gB exist as a homodimer which may be linked by disulfide bonds. HSV-1 gB is a 904 amino acid protein with an extracellular domain consisting of amino acids 31-730 and a cytoplasmic domain consisting of amino acids 796-904. HSV-2 gB is a protein also containing 904 amino acids with amino acids 23-727 making up the extracellular domain and amino acids 793-904 making up the cytoplasmic domain.

SOURCE

HSV-2 gB (1.B.44) is a mouse monoclonal antibody raised against HSV-2 gB.

PRODUCT

Each vial contains 100 µg IgG₁ in 1.0 ml of PBS with < 0.1% sodium azide and 0.1% gelatin.

STORAGE

Store at 4° C, ****DO NOT FREEZE****. Stable for one year from the date of shipment. Non-hazardous. No MSDS required.

APPLICATIONS

HSV-2 gB (1.B.44) is recommended for detection of glycoprotein B of Herpes Simplex Virus 2 origin by Western Blotting (starting dilution 1:200, dilution range 1:100-1:1000) and immunofluorescence (starting dilution 1:50, dilution range 1:50-1:500).

Molecular Weight of HSV-2 gB: 113 kDa.
