

Plasmodium falciparum (3561): sc-58181

BACKGROUND

Plasmodium falciparum is a protozoan parasite that causes malaria in humans. *P. falciparum* malaria is transmitted to humans by *Anopheles mosquitoes*, and this type of malaria has the highest rate of complications and mortality, accounting for 80 percent of all human malarial infections and 90 percent of the deaths. Only the early trophozoites and gametocytes are seen in the peripheral blood during a *P. falciparum* infection. Sometimes, faint comma-shaped red dots are seen on the erythrocyte surface. The *P. falciparum* genome is very rich in A and T bases (approximately 80%) and is organized into 14 chromosomes that hold just over 5,300 genes. *P. falciparum* contains a plastid similar to plant chloroplasts, which was acquired by engulfing a eukaryotic alga and retaining the algal plastid. The *P. falciparum* apicomplexan plastid is an essential organelle that may be involved in lipid synthesis. This plastid is a potential target for anti-malarial drug development.

RESEARCH USE

For research use only, not for use in diagnostic procedures.

SOURCE

Plasmodium falciparum (3561) is a mouse monoclonal antibody raised against histidine rich protein II from *Plasmodium falciparum*.

PRODUCT

Each vial contains 100 µg IgG₁ in 1.0 ml of PBS with < 0.1% sodium azide and 0.1% gelatin.

APPLICATIONS

Plasmodium falciparum (3561) is recommended for detection of histidine rich protein II (HRP2) of *Plasmodium Falciparum* origin by Western Blotting (starting dilution 1:200, dilution range 1:100-1:1000).

STORAGE

Store at 4° C, **DO NOT FREEZE**. Stable for one year from the date of shipment. Non-hazardous. No MSDS required.

PROTOCOLS

See our web site at www.scbt.com for detailed protocols and support products.
