## BACKGROUND

Chloride intracellular channel 5 (CLIC5), is a member of the highly conserved family of chloride ion channels that function in both soluble and integral membrane forms. Chloride channels regulate cellular traffic of chloride ions, a critical component of all living cells. They are involved in membrane potential stabilization, signal transduction, cell volume regulation and organic solute transport. CLIC5 associates with Actin-based cytoskeletal structures and may be involved in their assembly and maintenance. In addition, CLIC5 may also play an important role in inner ear function, localizing to the stereocilia and possibly associating with Radixin. Two CLIC5 isoforms exist, CLIC5A and CLIC5B, which share an identical C-terminus but have distinct N-terminal sequences. CLIC5B is the human ortholog of cow p64 and bird p62. It binds AKAP 350 and localizes to the Golgi apparatus.
