

EAF2 (C-18): sc-66369

BACKGROUND

The ELL family of RNA Pol II elongation factors function to activate transcript elongation by inhibiting the transient pausing of RNA Pol II. ELL associated factor 1 (EAF1) and EAF2 directly interact with the ELL family members, ELL and ELL2, functioning as transcriptional activators of their elongation activities. More specifically, EAF1 and EAF2 can form a complex with ELL that targets the ternary elongation complex of RNA Pol II, stimulating the rate of elongation. In addition, EAF1 and EAF2 are important for the stability of the NuA4 histone acetyltransferase complex which transcriptionally activates certain genes by acetylation of Histones H4 and H2A. EAF2, also known as U19, BM040 or TRAITs (testosterone-regulated apoptosis inducer and tumor suppressor protein), is a ubiquitously expressed member of the EAF family that co-localizes with ELL to the the Cajal bodies and nuclear speckles. EAF2 is an androgen-response gene and can act as a potent apoptosis inducer.
