

β -1,3-Gal-T4 (P-18): sc-67409

BACKGROUND

β -1,3-Gal-T4 (β -3-galactosyltransferase 4), also known as Gal-T2, is a member of the β -1,3-Gal-T family of type II membrane bound glycoproteins. It is expressed in various tissues including pancreas, heart, skeletal muscle and, to a lesser extent, brain, kidney, placenta, lung, liver and some cancer cells. β -1,3-Gal-T4 localizes to the Golgi apparatus. It consists of an N-terminal cytoplasmic domain, a transmembrane domain, a hydrophobic stem region and a catalytic domain. Unlike other β -1,3-Gal-T family members, β -1,3-Gal-T4 has only one N-linked glycosylation site. Enzymatic activity of β -1,3-Gal-T4 is dependent on glycosylation at this site. Active β -1,3-Gal-T4 catalyzes the addition of galactose (from the sugar donor UDP-Gal) to the N-acetylgalactosamine residue of gangliosides GM2, GD2 and GT2 or to the glycolipid GA2.
