

Sialyltransferase 7B (G-19): sc-68803

BACKGROUND

Sialyltransferase 7B, also known as ST6GALNAC2, STHM, SIAT7, SAITL1 or SIAT7B, is a 374 amino acid single-pass type II protein that localizes to the membrane of the golgi apparatus. Expressed in lung, kidney, heart, placenta and skeletal muscle, Sialyltransferase 7B functions to catalyze the addition of sialic acid residues to the non-reducing ends of glycoconjugates, an event that is important for protein targeting, bacterial adhesion and cell-cell interactions. Sialyltransferase 7B expression is downregulated in prostate and breast cancer cells, implying a role in growth inhibition. Human Sialyltransferase 7B, which shares 75% sequence identity with its mouse counterpart, is encoded by a gene that maps to chromosome 17.
