The Power to Question

## **BACKGROUND**

Estrogen and progesterone receptors are members of a family of transcription factors that are regulated by the binding of their cognate ligands. The interaction of hormone-bound estrogen receptors with estrogen responsive elements (EREs) alters transcription of ERE-containing genes. Estrogen receptor-related proteins (ERR $\alpha$ ,  $\beta$  and  $\gamma$ ) are orphan nuclear receptors. Like estrogen receptors, ERRs bind specifically to EREs to activate reporter genes. ERR $\beta$ , also known as steroid hormone receptor ERR2 or estrogen receptor-like 2, contains a DNA binding domain and is highly homologous to ERR $\alpha$ . ERR $\beta$  is expressed during mammary gland development and is critical in embryo development. It is expressed in a subset of diploid trophoblast cells which make up the chorion. The loss of ERR $\beta$  results in severely impaired chorion formation leading to placental failure and embryonic death. This suggests that ERR $\beta$  may be necessary for the proper formation or function of the chorion. In addition, ERR $\beta$  potently represses the transcriptional activity of Nrf2.
