# Arginine (3C110): sc-70381

The Power to Question

### **BACKGROUND**

Arginine is an  $\alpha$ -amino acid that is synthesized by humans in the urea cycle and is also found in many foods, including chocolate, wheat germ and flour, dairy products, beef, pork and nuts. Arginine is basic with a long side chain nearest to the backbone that is carbon-containing and hydrophobic and a complex guanidinium group on the end. The guanidinium group has a pKa of 12.48 and is positively charged in neutral, acidic and even most basic environments. Since Arginine has the ability to easily form hydrogen bonds, it is usually found on the outside of the proteins where it can interact with the polar environment. Arginine plays a key role in many biological processes, including cell division, wound healing, removal of ammonia from the body, immune function and the release of hormones. Arginine also functions as the immediate precursor of nitric oxide, urea, ornithine and agmatine.

## **SOURCE**

Arginine (3C110) is a mouse monoclonal antibody raised against asymmetric NG-NG-dimethyl Arginine.

# **PRODUCT**

Each vial contains 100  $\mu$ l ascites containing  $lgG_1$  with < 0.1% sodium azide.

## **RESEARCH USE**

For research use only, not for use in diagnostic procedures.

# **PROTOCOLS**

See our web site at www.scbt.com for detailed protocols and support products.

#### **APPLICATIONS**

Arginine (3C110) is recommended for detection of free and bound NG-NG-dimethyl Arginine by Western Blotting (starting dilution 1:200, dilution range 1:100-1:1000) and immunofluorescence (starting dilution 1:50, dilution range 1:50-1:500); may cross-react with free and bound asymmetric NG-monomethyl Arginine; non cross-reactive with unmodified free or bound Arginine.

## **STORAGE**

For immediate and continuous use, store at 4° C for up to one month. For sporadic use, freeze in working aliquots in order to avoid repeated freeze/thaw cycles. If turbidity is evident upon prolonged storage, clarify solution by centrifugation.
