The Power to Question

#### **BACKGROUND**

DEAD box proteins, characterized by the conserved motif Asp-Glu-Ala-Asp (DEAD), are putative RNA helicases. DEAD box proteins contain two conserved RecA-like domains that adopt different open structures in the absence of nucleic acid and closed structure when bound to RNA and ATP. They also exhibit RNA-dependent ATPase and ATP-dependent RNA-unwinding activities. DEAD box protein 19A (DDX19A) and DEAD box protein 19B (DDX19B), also known as DEAD box RNA helicase DEAD5 (Dbp5), are members of the DEAD box family. DDX19A and DDX19B localize to the cytoplasm and nuclear envelope and participate in the export of mRNA from the nucleus to the cytoplasm. DDX19B is activated by interactions mediated by Gle1 and is inhibited by Nup214.
