NSUN4 (C-14): sc-83447

The Power to Question

BACKGROUND

The nucleolus consists of a number of specific proteins that play a critical role in the assembly of ribosomes, as well as in the maintenance and structural integrity of the nucleolus. NSUN4 (NOL1/NOP2/Sun domain family member 4), also known as putative methyltransferase NSUN4, is a 384 amino acid protein belonging to the RsmB/NOP family and methyltransferase superfamily. NSUN4 exists as three alternatively spliced isoforms that are encoded by a gene mapping to human chromosome 1p33. Chromosome 1 houses a large number of disease-associated genes, including those that are involved in familial adenomatous polyposis, Stickler syndrome, Parkinson's disease, Gaucher disease, schizophrenia and Usher syndrome. Aberrations in chromosome 1 are found in a variety of cancers, including head and neck cancer, malignant melanoma and multiple myeloma.
