

LSm6 (H-40): sc-98326

BACKGROUND

Sm and Sm-like (LSm) proteins form donut-shaped, ubiquitously expressed heptameric complexes that are involved in various steps of RNA metabolism, including RNA-protein interactions and structural changes that are required during ribosomal subunit assembly. LSm6 is an 80 amino acid protein that localizes to both the nucleus and the cytoplasm and belongs to the LSm sub-family of snRNP Sm proteins. Functioning as a component of the heptameric LSm1-LSm7 complex, LSm6 is involved in mRNA degradation, specifically by activating the decapping step in the 5'-to-3' mRNA decay pathway. Additionally, LSm6 plays a role in facilitating the association of RNA processing factors with their substrates and may also be involved in the processing of tRNAs.
