SLC35G2 (T-14): sc-99675

BACKGROUND

SLC35G2 (solute carrier family 35, member G2), also known as TMEM22, is a 412 amino acid multi-pass membrane protein containing 2 EamA domains. SLC35G2 interacts with RAB37 and may play a role in cell proliferation. SLC35G2 is encoded by a gene mapping to human chromosome 3. Chromosome 3 is made up of about 214 million bases encoding over 1,100 genes. Notably, there is a chemokine receptor gene cluster and a variety of human cancer related loci on chromosome 3. Particular regions of the chromosome 3 short arm are deleted in many types of cancer cells. Key tumor suppressing genes on chromosome 3 encode apoptosis mediator RASSF1, cell migration regulator HYAL1 and angiogenesis suppressor SEMA3B. Marfan syndrome, porphyria, von Hippel-Lindau syndrome, osteogenesis imperfecta and Charcot-Marie-tooth disease are a few of the numerous genetic diseases associated with chromosome 3.
