ING3 (162.1): sc-101245

BACKGROUND

ING3 is a nuclear tumor suppressor protein that has been shown to activate UV-induced apoptosis through a Fas-mediated pathway. It has also exhibited the ability to regulate p53-mediated transcription and apoptosis, likely by acting as an agent of the NuA4 histone acetyltransferase (HAT) complex. Overexpression of ING3 increases the cleavage of apoptosis-related caspases and BID, however, this is done through a pathway that does not involve increasing the expression of mitochondrial proteins. Defects in the gene encoding ING3 lead to a decrease of UV-induced apoptosis and, thus, is believed to greatly affect the prognosis of melanomas and head and neck cancers.
