NPC2 (D-3): sc-166449

**BACKGROUND**

Niemann-Pick disease, type C2 (NPC2), also known as epiderdymal secretory protein, is a secreted protein mapping against gene 14q24.3. NPC2 regulates the lipid composition of sperm membranes during maturation in the epididymis. Mutations in the NPC2 gene may cause Niemann-Pick type C2 disease and frontal lobe atrophy. Niemann-Pick type C2 is a fatal hereditary disease characterized by defective lysosome release of cholesterol. The disease is caused by HE1 deficiency, a lysosomal protein proven to be undetectable in fibroblasts from NPC2 patients. This differentiates NPC2 from NPC1, as NPC1 has HE1 protein present.
