cytohesin-1/2 (D-11): sc-166542

BACKGROUND

Cytohesin-1 and cytohesin-2, also known as ARNO (ARF nucleotide-binding-site opener), are ARF guanine nucleotide exchange factors (GEFs). ARF (ADP Ribosylation factor) proteins, a group within the RAS superfamily, are GTP-binding proteins central to the process of vesicle budding. Cytohesin-1 and cytohesin-2 both contain an N-terminal coiled-coil domain, a Sec 7 domain responsible for GDP/GTP exchange activity and a C-terminal Pleckstrin homology (PH) domain. GEF activity of cytohesin-2 is enhanced by binding of the PH domain to phosphatidylinositol 4,5-bisphosphate which recruits cytohesin-2 to membranes. Cytohesin-1 catalyzes in vitro nucleotide exchange on ARF1 and ARF3, but it has no effect on ARF6. Cytohesin-2 is localized to the plasma membrane in mammalian cells and in vitro cytohesin-2 stimulates nucleotide exchange on ARF1 and ARF6.
