

CNOT1 (Y-15): sc-242483

BACKGROUND

The CCR4-NOT complex is an evolutionarily conserved, multi-component complex known to be involved in transcription as well as mRNA degradation. Various subunits within the complex are involved in influencing nuclear hormone receptor activities. The CCR4-NOT complex is also involved in the regulation of Histone H3 lysine 4 methylation through a ubiquitin-dependent pathway that likely involves the proteasome. CNOT1 (CCR4-NOT transcription complex, subunit 1), also known as NOT1, CDC39, AD-005 or NOT1H (negative regulator of transcription subunit 1 homolog), is a 2,376 amino acid protein exists as a subunit of the CCR4-NOT complex and belongs to the CNOT1 family. Highly expressed in lung, brain, placenta, heart, liver, thymus, kidney and spleen, with low expression in colon and skeletal muscle, CNOT1 undergoes alternative splicing to produce four isoforms. The gene encoding CNOT1 maps to human chromosome 16q21 and mouse chromosome 8 D1.
